

Our Solutions

1. GlobalTouch – ASP VoIP Solution

The ASP VoIP Solution is our hosted “**VoIP in a Box**” product. Utilizing our in-house design Solutions Platform, our VoIP Solution includes a fully working retail VoIP portal, as well as an enterprise communications platform. These two features provide quick access to any size VoIP market, scalable from a few thousand residential or enterprise seats to millions of customers around the world.

**We provide the
Technology,
you provide the
Brand**

Using your company name and logo, we will **Private Label** and brand the components to put you in the VoIP business. While you focus on marketing the services and collecting new VoIP revenues—we do the work. In addition, we offer “**Out of the Box**” solutions such as custom billing and provisioning to support your effort. Our ASP VoIP Solution includes two offerings:

Enterprise/ Business VoIP Solution

Our “business” VoIP solution includes many Class 5 features and unique applications that make it one of the most scalable, powerful and yet compact software-based enterprise communications platforms in the industry.

SIPTalk - Residential VoIP Solution

Our “residential” VoIP product is designed for the end user with a small number of lines and includes basic POTS (Plain Old Telephone Service) features. It may also be used while traveling worldwide where Internet access is available. SIPTalk is intended to be offered through agents, marketing companies, entrepreneurs, or even strategic partnerships with handset or other end-user device makers. SIPTalk is also an important feature of the GlobalTouch VoIP ASP Solution.

GlobalTouch offers the best quality VoIP services in the industry today because it utilizes its own in-house technology, rather than a mix-and-match of third party components. When components from a variety of vendors are put together, interruptions and compatibility issues may result. The interoperability of GlobalTouch Solutions is superior and we guarantee it. Our engineers have even helped other companies solve their VoIP problems. The GlobalTouch technical staff has created a solid foundation for improved functionality, more economical operation and provisioning, and “feature rich” VoIP technology, which is patent pending and ready for your customers.

2. SIP Trunking Solution

The GlobalTouch SIP Trunking Solution allows for customers using a legacy key system to take advantage of new VoIP termination rates which are lower than traditional analog service provided by an IXC or RBOC.

3. Prepaid VoIP Solution

A prepaid VoIP solution that provides the carrier, reseller or prepaid card distributor with an end-to-end solution that enables accelerated entry into the lucrative prepaid voice market. This state-of-the-art platform’s extensive feature-set includes a multi-level distribution model, online credit card processing, billing, and real-time management software to name just a few.

4. Hosted IP PBX Solution

The Hosted IP-PBX platform is a hosted PBX service for small to medium sized businesses and is more flexible, scalable and easier to maintain for the enterprise than traditional premises-based systems. Adding new users or features requires no on-site hardware changes, dramatically lowering both capital and operating expenses. The IP PBX can be configured via a Web Interface for adds, moves and changes, within minutes rather than days or weeks. Costly monthly maintenance contracts and high labor costs for on-site techs is a thing of the past!
